SKILL 1

Creating an IAM User in AWS

Aim: To create an AWS IAM user, assign permissions, and retrieve console sign-in details.

Steps

1. Sign in to the AWS Management Console.
2. Search for **IAM** and open the IAM service.
3. Select **Users**, then click **Create user**.
4. Enter the username **mohitkarthik** and enable console access.
5. Choose a custom password and require a password reset at first sign-in.

AWS IAM is used to manage users and control their access to AWS resources.

Step 2 — Assign permissions and create the user

1. On the permissions page, choose the required permission policies.
2. The practical screenshot shows **AdministratorAccess** and **IAMUserChangePassword**.
3. Review the username and selected permissions.
4. Click **Create user**.

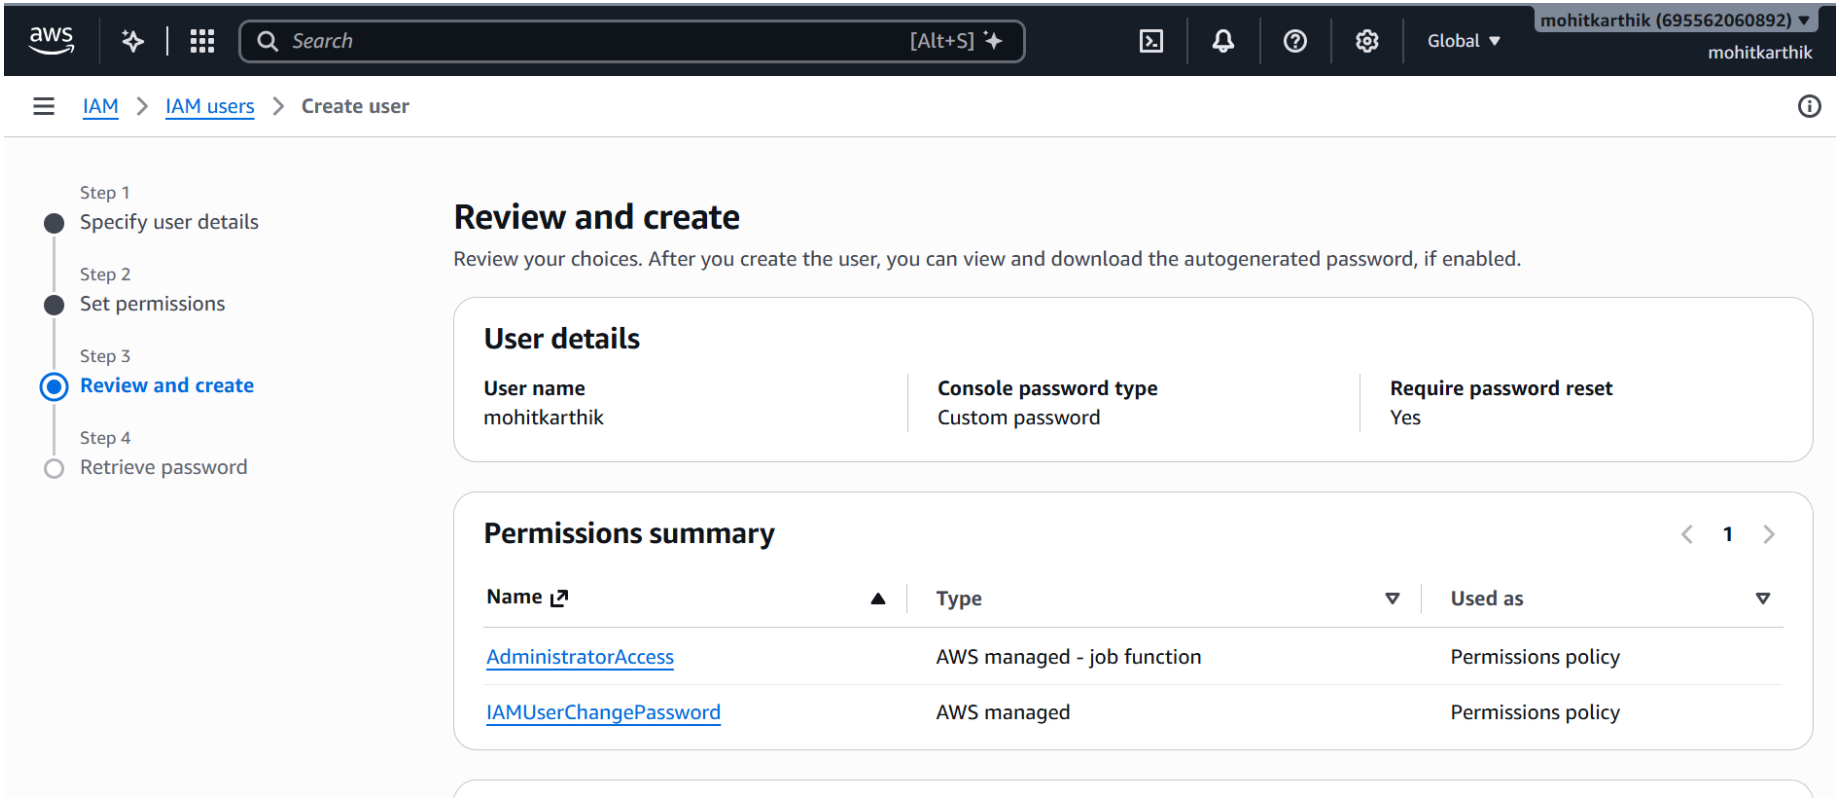

Figure 1: Review page showing user details and permissions.

Note: AdministratorAccess provides broad account access. Use it only when full admin access is required.

Step 3 — Retrieve sign-in details

1. After creation, AWS displays a success message.
2. On the Retrieve password page, copy or download the initial password.
3. Save the password securely; AWS shows it only at this stage.
4. The user signs in using the console URL and username, then changes the password if prompted.

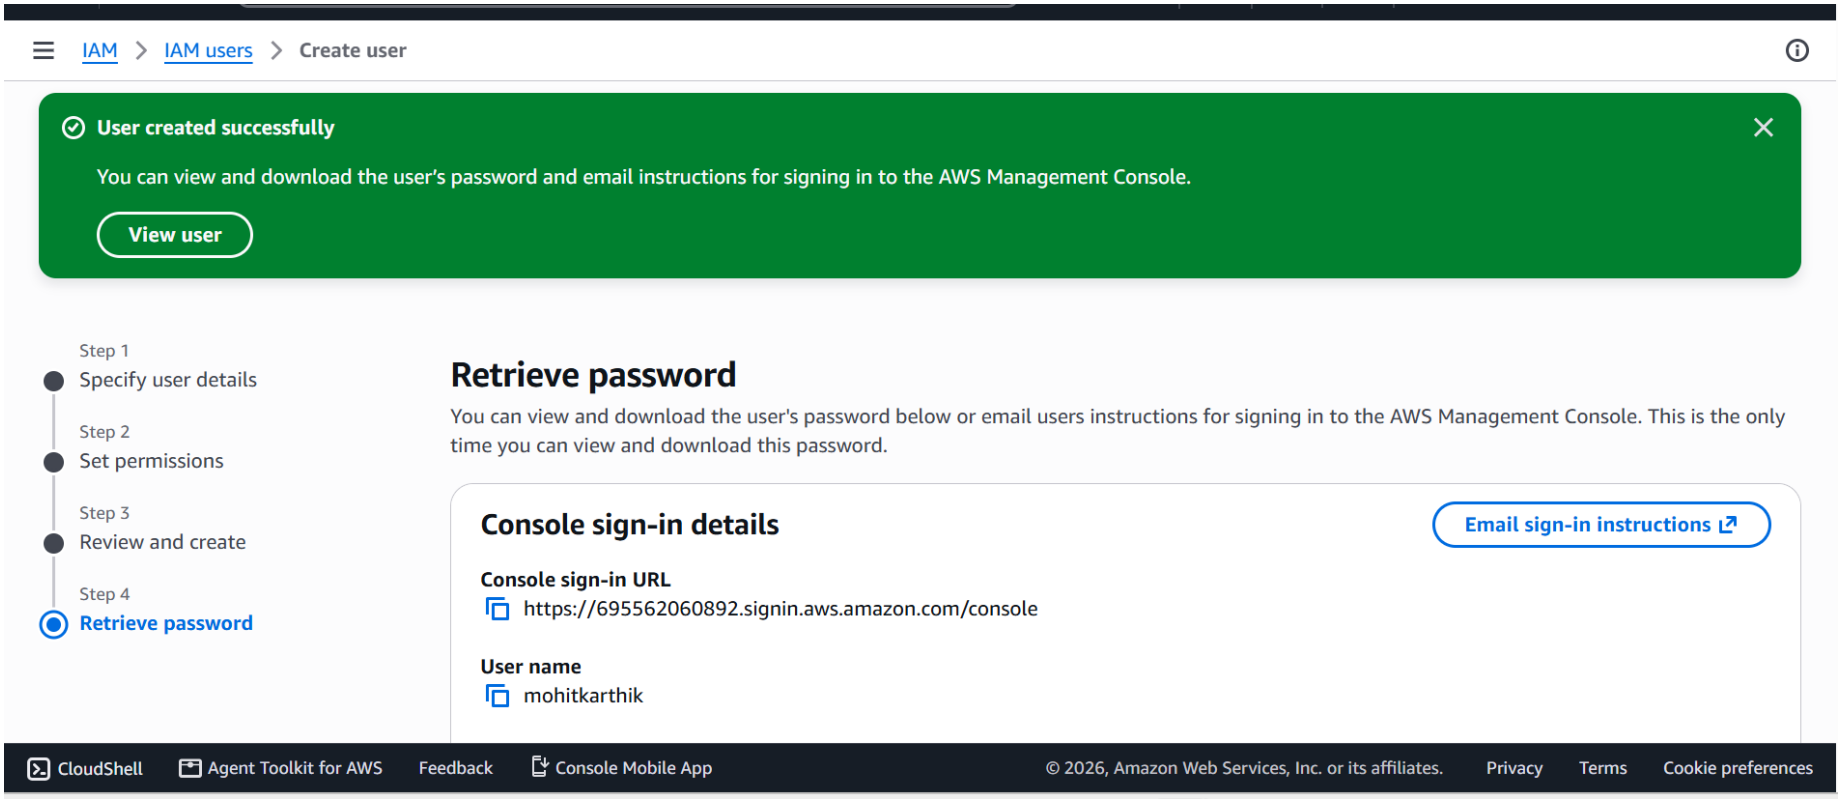

Figure 2: User created successfully and console sign-in details displayed.

Result: The IAM user **mohitkarthik** was created and the selected permissions were attached.

Security: Never share passwords. Prefer least-privilege permissions and enable MFA where possible.
